Abstract (en)

[origin: EP0330883A1] The invention relates to a stopper, in particular for bottles or the like containing infusion solutions, with a resilient stopper part (1) which can be sealingly introduced into the bottleneck (9) and rests by means of a bearing shoulder (7) on the bottleneck (9), and a lid part (2) which is connected therewith, and proposes, in order to achieve a particularly optimum practical solution, that the lid part (2) is assigned to the stopper part (1) by means of a clamping plug connection, in that the stopper part (1) possesses a recess (14) for the splaying entry of a flange (13) projecting on the lid part (2), and a flanging cap (3) is clamped between the stopper part (1) and the lid part (2). <IMAGE>
