Abstract (en)

[origin: EP0331121A2] The subject of the invention is an articulated gangway as a component of a disconnectable intercommunication passage between two rail vehicles coupled to one another in an articulated fashion, said gangway having a plurality of rod-shaped tread elements (16) which are consecutive in the longitudinal direction of the gangway, run in the transverse direction of the gangway and whose ends are assigned in an articulated fashion to the side parts of a frame following approximately the circumferential contour of the gangway, the one end part of said frame which runs in the transverse direction of the gangway being constructed for attachment to one of the two rail vehicles to be coupled to one another and the other end part of said frame which runs in the transverse direction of the gangway being constructed for attachment to the corresponding end part of the articulated gangway of the other of the two rail vehicles coupled to one another. The frame end part which runs in the transverse direction of the gangway and is to be assigned to one of the rail vehicles coupled to one another is mounted on a slide (4) which is adjustable in the longitudinal direction of the gangway in a trough of the rail vehicle through an adjustment path which is derived from the longitudinal play in the coupling between the two rail vehicles. <IMAGE>
