Abstract (en)

[origin: EP0332028A2] A wet treatment device, consisting of a plurality of liquid tanks, for photographic layer supports which can be moved through the liquid tanks by means of a transport device, wherein tank surfaces can be covered by lid parts against a place where the wet treatment device is set up, is designed in such a way that a common cover (12), reaching over the lid parts (11), for the tanks (2 to 5) is made of heat-insulating material or constructed as a hollow body (12b, 12c) and includes an insulating layer (13). This provides a hermetic seal and a temperature insulation of the tanks from the place where they are set up, avoiding the formation of condensate water and chemicals vapour, and at the same time greatly reducing the oxidation of the treatment solutions and moreover preventing an escape of chemicals vapours into the place where they are set up.
