Abstract (en)

[origin: EP0332208A2] The invention relates to a switching system for furnishing printed- circuit boards, having at least one switching element which has a housing with a switch arranged therein, a trigger (projecting from the housing) for operating the switch and contact terminals guided out of the housing. In this case, housing projections are provided which are provided with snap elements by means of which the housing projections can be attached via corresponding latch cut-outs in each case on the housings of the switching elements in such a manner that the housing projection bridges over the trigger, the housing projection having an opening which holds an actuator for the trigger, the actuator being designed in a manner corresponding to the desired switch type. <IMAGE>
