Abstract (en)

[origin: US4949666A] In an apparatus for the coating of spacer frames for insulating glass, exhibiting corners bent in one piece, with adhesive and, respectively, sealing compound, the relative position between the connecting line of the orifices of the nozzles, on the one hand, and the axis, about which the turning device is pivotal, on the other hand, can be varied. This variability is achieved either by arranging the pivotal support of the turning device to be movable laterally and vertically (upwards and downwards) in the frame of the apparatus, or by disposing the component carrying the nozzles in the frame of the apparatus to be vertically movable (upwards and downwards) and the pivotal support of the turning device to be movable laterally. In this way, the objective is attained that the nozzles remain aligned, even during turning of the spacer frames, in opposition to the lateral faces of the spacer frames.
