Abstract (en)
[origin: WO8902491A1] A weaving machine comprises a guide device (12b) for a cloth run (10), a cutting device (18) arranged between the guide device (12b) and a breast beam (40), followed by a fixation device (18). All aggregates are independently mounted on the weaving machine. Independent mounting greatly facilitates access to the individual aggregates for adjustment and repair purposes and the cutting heads (20) of the cutting device (18) can be adjusted in the warp direction. Cutting can thereby be synchronized with a pattern repeat. The cloth run is nevertheless carefully guided to ensure accurate cutting according to pattern.
