Abstract (en)

[origin: EP0334753A1] The fuel feeding device for an internal combustion engine, usable particularly on motor vehicles, comprises a constant level chamber (14) arranged in a housing located next to the engine, fitted with means of cooling, at least when the hot engine is stopped. These means of cooling consist of a heat exchanger (40) in thermal contact with the chamber and means of circulating the cooling liquid inside the exchanger.
