Abstract (en)

[origin: EP0336242A2] It is known to link handball goals (1) to extension arms which, in turn, are linked to a gymnasium wall so that, in conjunction with a cable drive acting on the goal frame, the handball goal (1) can be folded against the wall and, in this case, is situated at a height depending on the length of the extension arms. If the respective gymnasium is also used for football, the football goals (2) have to be set up and dismantled manually. By means of the device according to the invention, football goals (2) are linked via extension arms to receiving rails (14) which, in turn, are guided vertically in a slidable manner in guide rails (13) on the gymnasium wall. The football goal (2) can thus be stored at a height on the wall which allows the simultaneous storage of the handball goal (1). Both the handball goal (1) and the football goal (2) can be moved by means of special cable drives between a lower position, set up on the gymnasium floor, and an upper position situated on the wall. <IMAGE>
