Abstract (en)
[origin: EP0337236A1] An electrical terminal, whose terminal body (1) is formed using a folding technique from limbs (2, 3) on both sides to form a face (4) which guides a terminal screw (5). It is provided that one limb (2) has at least one penetrating window (6) through which the other limb (3) is inserted with a tongue (7), as a result of which the limb (3) on which the tongue (7) is constructed forms the terminal base (8), lateral T-shaped, undercut fins (9, 10) projecting on this limb, which fins are bent in with their ends (12, 13) that are cut free under the end (11) of the limb (2) which is laid around under the base (8) and which has the penetrating window. <IMAGE>
