Abstract (en)

[origin: EP0337952A1] The invention relates to a sewing-machine frame comprising a supporting base (10), a column (9) projecting from this base and carrying two horizontal arms (7,8) intended for respectively supporting the sewing needle and its control mechanism (M1), as well as a device (M2) for driving the material to be sewn and a loop sensor. The frame consists of a mass of plastic (6) and comprises a resistant skeleton (2,3,4 and 5) extending at least over some of the length of the arms/or of the column. The skeleton is fixed to the mass of plastic and has such dimensions that this mass is not damaged under the action of the forces exerted on the frame when the machine is in operation. <IMAGE>
