Abstract (en)
[origin: WO8902167A1] An electric coupling device comprises a test contact strip fastened to an appliance frame, a housing which can be mounted in a space in the appliance frame by means of two pivot pins interspaced along the same axis and which houses a socket terminal strip, levers hinged to the appliance frame and which can be inserted with sliding block cranks in slotted grooves in the housing for swivelling the housing to the appliance frame, and coding means arranged on the appliance frame and housing. To ensure simple, reliable, and variable coding, between the pivot pins (11) the socket terminal strip housing (3) has a row of previously made slots (30) with notched contours and open front ends in the direction of plugging, and between the pivot pins (12) the appliance frame (1) has at least one coding pin (31) which can be interchangeably and firmly inserted in openings in the appliance frame and introduced into slots (30) in the socket terminal strip housing (30).
