Abstract (en)
[origin: EP0338231A2] The invention relates to a crushing plant, in particular for the production of cement, with a mill, a dynamic air separator as the main separator, a static air separator fitted in the off-gas line of the mill, and a fines separation device connected to this off-gas line. To provide the possibility, in a simple manner, of producing the end product in wide limits with an adjustable particle size distribution, the static air separator is designed as a deflection separator with a relatively coarse separation threshold, and an adjustable switch makes it possible to feed the fines coming from the fines separation device optionally to the finished product or to the dynamic air separator (main separator).
