Abstract (en)  
[origin: EP0340346A1] For the suspension of flaps (2) or the like, arranged hanging and pivotable through approximately 180 degrees, in the vertical side walls of commercial-vehicle bodies, which, in their closed position, are seated in alignment in the side wall (1) of the body and which, in their end opening position, are directed at least approximately parallel to the side wall (1) of the body, it is proposed that the flaps (2) be held cantilevered in the aperture of the side wall (1) of the body by means of an articulated parallelogram (3), the articulated parallelogram (3) being attached, on the one hand, in its end region to the flap (2) and, on the other hand, to a carrier (4) arranged at a distance from the vertical outer face of the side wall (1) of the body, and being equipped, on the one hand, with a limit stop defining the end closing position of the flap (2) and, on the other hand, with an adjusting device for adjusting the flap (2) in its position in alignment with the body side wall (1). <IMAGE>
