Abstract (en)

[origin: EP0340756A1] The invention relates to a method and a device for monitoring the levelling of at least one sliver 3 in a controlled drafting arrangement, especially a drafting frame, deviations in the mass of the sliver 3 being detected by at least one measuring element 4, 5 and being compensated via a controller 10 and at least one actuator. According to the invention, the measurement values of the measuring element 4, 5 and/or the regulating signals of the controller 10 are compared with at least one adjustable limit value, and when the limit value is exceeded an indicator 14 and/or a switching operation is triggered. <IMAGE>
