Abstract (en)  
Holder (1) with cylindrical wall (2), bottom and upper wall (3). Two cap-shaped portions (4,5) are arranged in the upper wall (3) roughly diametrically opposite one another. The cap-shaped portions (4,5) can be pressed in by the applying of a force. Placed on the upper wall (3) is a cover (6) in which openings (7,8) are arranged at the same angular distance relative to one another as the cap-shaped portions (4,5). Situated on the inside of the cover (6) is a stop (9) which, if the cover (6) is turned as far as a cap-shaped portion (4,5), presses this portion in and therefore opens the holder (1).
