Abstract (en)
[origin: EP0341338A1] The securing device is composed of a soil sleeve (1) and an anchoring plate (2) and serves for securing columns, for example of a clotheshorse. The soil sleeve (1) has a plurality of spaced-apart rows (19) of protruding bulges (10), which bear on the anchoring plate (2) when the soil sleeve (1) is set. Depending on the soil conditions, the correspondingly suitable bulge row (19) is assigned to the anchoring plate (2). The anchoring plate (2), in the central opening (11) of which recesses (20) corresponding to the extent of the bulges (10) are made, is of circular shape and has at its plate edge a cylindrical flange (14), whose parts of unequal length merge into one another by inclined edges (15). The securing device guarantees by means of the anchoring plate (2) provided with the flange (14) reliable lateral guidance and additionally permits adaptation to different soils. <IMAGE>
