Abstract (en)

[origin: JPH01318677A] PURPOSE: To render a door latch inoperative by providing a control means between an electric motor for rotating a reversible screw and a lever, a connecting kinematic mechanism between a cam rotatably mounted on a pin and an internal lever, and a movable cam surface. CONSTITUTION: This actuator comprises an electric motor capable of driving in rotation of a reversible screw 2 through a clutch 3 and gear trains 4, 5, and a cam 10 rotatable mounted on a pin A, the cam 10 being connected to a case 18 for housing such components and the components of the actuator itself. The cam surface is made into the form allowing the process from the position of an inner lever 17 for rendering a latch inoperative and an inner lever 20 for controlling the opening of the latch to the position for rendering the latch inoperative or operative, and the process to the theft preventing position by releasing the inner lever 17 and locking the inner opening lever 20. According to this, any manual operation of the latch from the theft preventing position to the operative position can be arrested.
