Abstract (en)

[origin: EP0342161A2] The apparatus comprises a protection casing (2) having a base portion (6) fixable to a wall (3), an upper portion (8), and two side portions (9) extending downwardly from the upper portion. An air delivery unit (4) is contained between the upper portion (8) and side portions (9) and is slidably engaged relative to the casing (2) to be displaced from a non-use position to an operating position. When in its operating position, said air delivery unit (4) is actuated by a pushbutton (5) housed in the casing (2) and operated by the delivery unit itself. A return spring (16; 17) and/or a magnet (18) act between the casing (2) and the delivery unit (4) so as to dispose the latter in its operating position when a flexible hose (15) associated with the delivery unit is manually lifted by a user.
