Abstract (en)
[origin: EP0342293A1] A hinge comprises a hinge member including a socket (2) for attachment to a door, a hinge body (3) coupled rotatably to the socket by arms (5,6), a plate member (4) detachably connected to the hinge member and for attachment to an attaching member of the door, latches (16,17) provided at least at the front and rear portions of either the hinge member or the plate member, and a locking member (20) formed with latch pieces (27a, 27b, 28a, 28b) for detachably latching the latches, the locking member being longitudinally slidable and urged forward by a spring (30) in such a manner that the latch pieces engage the latches, which are formed with oblique surfaces inclining downwards in the forwards direction of the locking member. Thus, the hinge member and the plate member can be easily and positively coupled from any of a wide range of directions relative to the hinge, can also be detached in a simple manner, and also a single such hinge can be attached and detached on its own.
