Abstract (en)
A cabinet for displaying a large number of articles has a plurality of sides each defining at least one concave see-through surface through which the articles can be seen. A person standing in front of the midportion of each see-through surface finds himself at a short distance from either end thereof, too, and can, therefore, look at all of the articles displayed in the cabinet between the opposite ends of the see-through surface without moving away from the place where he stands.
