Abstract (en)
[origin: EP0343493A1] The electric mantelpiece clock comprises a plate (28) carrying a motor (11), a movement (21) and hands (82, 100) for displaying the hour, and a base-middle part (10) carrying electrical and electronic elements (7, 9) resting on a printed circuit (3) which is itself fixed in the base-middle part. Electrical connections (15, 17) between the motor and the printed circuit are established when the base-middle part is made integral with the plate. If the mantelpiece clock comprises an alarm device, other electrical connections (129, 127) are also established between the alarm mechanism (66, 88) and the printed circuit when the base-middle part is made integral with the plate. <IMAGE>
