Abstract (en)

Method for producing a rolling door or rolling shutter, whereby a flexible support means is clamped between two mould halves, at least one of which is provided with a number of channel-shaped recesses extending at least substantially parallel to one another, and subsequently a plastic material is injected into the mould at at least one side of the support means. A foil of polypropylene is used as a support means, in such a manner that the molecules of the foil material will be directed transversely to the channel-shaped recesses.
