Abstract (en)

[origin: EP0344076A1] This device ensures the "detachment" of an inserted pick (12) detected as being defective, by moving it away from the preceding pick (13) by means of an air injector (14) connected to a compressed-air source (16). The injector (14) is moved over the entire width of the fabric (9) in parallel with the direction of the weft threads. After the "detachment" of the defective pick (12), the latter is extracted permanently, for example by other pneumatic means (22). <??>The invention is used on a loom of the air-jet and other types. <IMAGE>
