Abstract (en)

This sanitary apparatus (1) comprises a bowl (3) and a flushing tank (4), moulded in one ceramic piece, with the bowl (3) comprising on its upper edge an inverted channel (14) permitting the distribution of the flushing water over the entire surface of the bowl (3), and communicating with the tank (4) via a distributor (16), a distributing member (15) being inserted partially in the distributor (16) and partially in the adjacent zone of the channel (14). According to the invention, the distributor (16) forms the bottom (17) of the tank (4) and comprises bosses (24-25) separated by at least one groove (30) permitting the installation of the distributor (15) on the wall of the distributor (16). The tank (4) contains a cistern (37), the bottom (38) of which bears on the bosses (24-25) and has a central water-outlet orifice (40) which cooperates with a flushing mechanism (41) capable of sealing it, bearing on the bottom (38), the orifice (40) being arranged vertically in line with the upstream end (32a) of the distributor (15).
