Abstract (en)

[origin: EP0345413A2] The invention relates to a dispenser for delivering tablets one after the other, with housing (1), a stroke-arrested displaceable slide (3) and a tablet storage chamber with adjoining dispensing shaft (7), end closing-off surfaces and profiled sides being designed to be proportionally fixed to the housing and being proportionally formed on the slide (3), and, furthermore, a separating chamber (A) being designed in the movable side and, in the side fixed to the housing, a separating finger (F) assigned to the separating chamber, and proposes, in order to achieve a solution which is constructionally simple, functionally optimal and protects the tablets, that the separating finger (F) is formed by a bottom-side tip (22) of a first inclined surface (I) which starts on the upper side opposite the upper closure (23) of the separating chamber (A), and that, on the movable side (d), a second inclined surface (II) is designed, which, starting on the upper closure (23) of the separating chamber (A), extends upwards, continuously enlarging the cross-section of the dispensing shaft. <IMAGE>
