Abstract (en)  
[origin: EP0345563A2] In an apparatus for the automatic calibration of gas sensors which, in particular, are combined in a gas detection system having a multiplicity of measuring heads which are connected to central evaluation electronics and carrying gas sensors, it is proposed for the purpose of facilitating perfect calibration by one man that when a calibration device in the preferred form of a calibration cap is placed on the measuring head in conjunction with the simultaneous provision of a flow of a calibration gas to the gas-sensitive region of the particular sensor a calibration signal is fed to the measuring head electronics and is relayed by the latter to the central evaluation electronics, which thereupon confirm the entry into the calibration phase, automatically recognise the particular calibration gas, automatically monitor the calibration process, automatically accept the particular calibration value, and in so doing continuously inform the operator, who is feeding the test gas, about the course of the calibration process. <IMAGE>
