Abstract (en)

[origin: EP0345622A2] The invention relates to an apparatus for attaching buttons, rivets or the like, especially to garments, in which the different individual button parts (22, 23, 24, 25) are fed to the attaching position from magazines, and its drive acts via a power transmission member on a lifting ram (26, 27) of a top tool (9), to which a stationary bottom tool (10) is assigned, and the invention proposes, for the purpose of attaching more than three different button parts without changeover of the machine that the top tool (9) has at least two lifting rams (26, 27) which each interact with a die (28, 29) of the bottom tool, and that the power transmission member can be coupled via a switching apparatus (118) optionally to the one or the other lifting ram (26, 27). <IMAGE>
