Abstract (en)  
[origin: EP0346524A2] The invention relates to a securing device for assembled tubular scaffolding joints, together with a level-regulating means. For reusable scaffolding units it is a desirable aim to be able to relocate units which are as large as possible in order to minimise setting-up and shuttering times. Sleeve joints in scaffolding units have to be secured during relocating, for which purpose the invention proposes a universal solution for a securing device. The securing device according to the invention is distinguished in that it is fitted in the inaccessible, protected area of the hollow cross-sections and the individual parts, such as insertable end plates, spindles, butt joint connectors and the like are held together resiliently in one unit, so that infinitely variable adjustments can be made even under load. <IMAGE>
