Abstract (en)

[origin: EP0346583A2] A pressure bar (13) consisting of a plate-type shaped part having at least two openings (15), extending in the same direction and extending in approximately U-shape, for accommodating at least two pairs of clips of a ring binder mechanism is designed in such a way that at least one side limb (16) in each case of the U-shaped openings (15) is constructed so as to extend obliquely in such a way that its distance from the adjacent side limb (16) is shorter at the free end of the side limb (16) than in the transition region to the base limb (17). Thus an adaptation of the pressure bar (13) to the distance, which decreases in the upper rounded transition region of the ring binder mechanisms, between the respective halves of the clip is readily possible. <IMAGE>
