Abstract (en)
[origin: EP0346779A1] In a projectile for practice, a thin-walled ogive-shaped hood (5) is placed onto a projectile body (1). The hood (5) is on the one hand intended to withstand the forces occurring during firing. On the other hand, the range of the projectile in the event of target rebounds will be reduced. For this, there is arranged in a free space (6) between the projectile body (1) and the hood (5) a plastic supporting part (7) which is inserted by means of a pin (8) into an axial bore (4) of the projectile body (1). Webs (9) of the supporting part (7) which are arranged in the form of a star bear with their outer edges (10) against the hood (5). <IMAGE>
