Abstract (en)
[origin: EP0347368A1] The invention relates to a device for controlling a crane moving on a carrier, a trolley or the like, the motors of which are controlled via electrical lines by a control switch suspended on a control line. In order to make the power supply to the trolley of a crane or the like, or to the crane itself less complex, in which case the impedance should be removed and the control switch be moveable along the carrier independently of the position of the trolley or of the crane according to the position of the crane operator, it is proposed that the control line (8) of the control switch (7) is mounted on a jib (6) which is displaceable on the carrier (1) independently of the trolley (4) or the like, said jib extending over the parts of the trolley (4) present on the jib side of the carrier (1). <IMAGE>
