Abstract (en)

The barrier comprises a row of identical vertical frames (1a to 1d) articulated to one another by means of connection elements (10), each essentially composed of two shells of drawn sheet metal which are assembled face to face by bolts in order to form tubular parts freely surrounding the adjacent posts (3). One of the shells is integral with a lateral arm (11) for bearing on the ground. One of the posts can slide relative to the other in order to permit two adjacent frames to have different heights. A pair of coupling elements (13, 14) formed according to the same principle makes it possible to assemble the two ends of the barrier. <IMAGE>
