Abstract (en)

[origin: EP0347847A2] The surface finishing system for rotationally symmetrical workpieces has a number of successive machining stations along the workpiece feed path, using individually adjustable finishing stores (20) vibrated via a common oscillation drive (32). The latter is monitored by an oscillation sensor (50) providing an electrical output signal for a control microprocessor (80). This compares the detected oscillation with a supplied reference value to allow a constant oscillation amplitude to be maintained. The oscillation is detected via an acceleration sensor coupled to the microprocessor (80) via integrators.
