Abstract (en)

[origin: EP0348380A1] Use of an iron-based alloy for the production of sintered parts of high corrosion resistance, high wear resistance, high toughness and high compressive strength, in particular for processing plastics, having a composition, in % by weight, chromium 16.0-29.0, molybdenum 0.4-2.5, tungsten 0.3-2.0, vanadium 3.0-10.0, titanium up to 5.0, aluminium up to 1.0, boron up to 0.05, nitrogen 0.01-0.18, niobium up to 5.0, iron and preparation-related impurities as the remainder, the value formed from $(\% \text{ of Cr - 13}) + 4.4 \times (\% \text{ of V - 3}) + 2 \times (\% \text{ of Nb}) + 4.2 \times (\% \text{ of Ti})$ being greater than 8.8, and the minimum carbon content of the alloy corresponding to the correlation $C_{min} = 0.3 + [(\% \text{ of Cr - 13}) \times 0.06] + [(2 \times \% \text{ of Mo + W}) \times 0.03] + (\% \text{ of V} \times 0.24) + (\% \text{ of Nb} \times 0.13) + (\% \text{ of Ti} \times 0.25)$ and the maximum carbon content of the alloy corresponds to the correlation $C_{max} = 0.7 + [(\% \text{ of Cr - 13}) \times 0.06] + [(2 \times \% \text{ of Mo + W}) \times 0.03] + (\% \text{ of V} \times 0.24) + (\% \text{ of Nb} \times 0.13) + (\% \text{ of Ti} \times 0.25)$, with the proviso that the matrix has a chromium content of at least 13% after hardening and annealing, and the carbide content is at least 25% by volume, the carbide grain size being less than 14 μm and at least 5 % by volume of the carbides being in the form of MC carbides.
