Abstract (en)
[origin: EP0348750A1] The bottle case comprises a rigid case body (10) having a bottom (11) which is surrounded by four standing lateral walls (12,13,14,15). Gripping slots (18) are provided in two opposite lateral walls (12,13) and, according to the invention, are in each case formed in a rotatable disc (16). Access is made ergonomically easier by the angularly adjustable gripping slots (18). The two rotatable discs (16) with the gripping slots (18) adapt the position of the gripping slots, when hands are inserted, relative to the still perpendicular alignment of the bottle case to the respective adjustment angles in such a way that the hand (50) and forearm (51) always form a straight line (53). Irrespective of the position of the carrier, the bottle case can be lifted up and set down without excessive turning of the wrists. <IMAGE>
