Abstract (en)

[origin: JPH0253051A] PURPOSE: To easily positioning a film by forming a first window through which the blade of a cutting member passes and a second window for the path of a motor driving pressure roller on a straight line part guiding the film. CONSTITUTION: Two apertures 20 and 21 facing to each other which have a first window for the blade 30 of the cutting member to pass through in the case the unwinding of the film 12 comes closely to completion are formed on two straight line parts 14 and 16. This window is constituted of a first aperture 21 formed on the straight line part 14 of a lower part shell 3, on the other hand, the aperture facing to the aperture 21 being the window 20 is formed on the straight line part 16 of the upper shell 2. Apertures 22 and 23 facing to each other for the first set of pressure rollers 24 and 25 for feeding the film 12 are formed on the parts 14 and 16. Thus, the device can be simplified and the film positioning can be facilitated.
