Abstract (en)  
A superstructure for live H.E.A.T. missile target practice, the superstructure comprising a plurality of panels (1) mounted on a underframe (12) in staggered and preferably overlapping relationship such that, when the superstructure is viewed face on, the panels visually present together a substantially continuous target area. A metal panel member may be provided in front on the panels just mentioned, which panel member is arranged to drop down when actuated to reveal the target area behind it. The panels (1) can comprise a comparatively thick layer of polyurethane foam material sandwiched between two layers of a softer fibreglass, the consistency of both the fibreglass material and the polyurethane foam material being such that the live H.E.A.T. missiles are intended to pass through the material without detonation.
