Abstract (en)
[origin: EP0349759A2] In an electromagnetic relay, which simultaneously serves for actuating a plurality of contact springs belonging to various make circuits, the contact springs are arranged about a common centre formed by a common servo element. The servo element can be activated by the armature of a relay coil, its direction of movement coinciding with that of the armature. The relay coil is preferably designed as a pot magnet, through the centre axis of which a rigid connection between the armature and the coil extends. <IMAGE>
