Abstract (en)

[origin: EP0350525A1] The invention relates to a method for producing building walls (10) made of concrete or the like and a shuttering system. A sliding shuttering and a corresponding method have proved inflexible in many respects, shuttering construction and fastening also having to be carried out to some extent under great time pressure. The invention provides a solution for this by combining the advantages of a sliding scaffold in the construction of high buildings with the advantages of a climbing shuttering. This is achieved by attaching a plurality of adjoining shuttering panels (21, 22, 23) over a certain height substantially in the vertical and, if appropriate, in the horizontal direction. These shuttering panels are temporarily held stationary. To raise the building wall, the shuttering panel or the lowest shuttering panels is/are moved upwards. <IMAGE>
