Abstract (en)
[origin: EP0350826A2] Delaying device having an energy store Known delaying devices are based on a periodic opening and closing of contact points for current limitation. This can lead to a premature wear of the contacts. A novel delaying device (10, 34, 50) is combined with an energy store (12, 38, 52), mechanical inhibition means (16, 24) or fluid inhibition means (41, 66) being used to delay in time the resetting by the energy store (12, 38, 52). Switchgear equipped with the novel delaying device are employed in particular as selective automatic circuit-breakers. <IMAGE>
