Abstract (en)
[origin: EP0351217A2] The apparatus is intended to determine the value of a batch of mixed coins inserted by the user into a hopper unit (1) in which there is a rotatable disc (2) for feeding the coins in single file past a coin discriminator (6) to an escrow region (11). The total value of the coins retained temporarily in the escrow region (11) is displayed on a suitable display to the user, who can then choose either to have the coins returned to him, or allow the transaction to proceed for which the coins are payment. The apparatus may be used in a bank to issue a receipt for coins inserted, or as a lottery machine to issue lottery tickets. The machine can be arranged to return the coins in the escrow automatically to the user if the value of such retained coins does not, after a certain time, fall within a preset range.
