Abstract (en)

[origin: EP0351721A1] In a suspension frame for a seat or bed, which is capable of carrying out vibrations, consisting of a support structure (13, 22), connected to the seat or lying surface, on both sides of the seat or lying surface, which support structure is connected to a base structure (1, 26) via cable suspenders (5, 6, 11; 24), provision is made for at least two cable suspenders to act on each side of the support structure in order to make it possible for there to be a very great sensitivity to only slight movements of the human body or vibration conditions in the apparently resting human body, in particular whilst retaining satisfactory statics. <IMAGE>
