Abstract (en)

[origin: EP0351764A1] The present invention relates to a male element for hinges of door and window frames or the like, composed of a cylindrical body (2) from which a rotation pivot (3) axially extends. The male element is axially provided with a first hole (4) in which a dowel (5) is inserted; the dowel has a substantially hemispherical end (6) which protrudes from the pivot. The body is axially provided with a second hole (7) in which the fork-like end (9) of a threaded fixing stem (10) is inserted so as to embrace the dowel. The bottom (8) of the second hole is shaped so as to provide the plastic deformation of the fork (9) when it is inserted, stably fixing it to the dowel and/or to the body.
