Abstract (en)
[origin: EP0351811A2] In order to improve the service life of the die, the cycle time and the structural quality of the casting to be produced on casting using the low pressure die casting process, it is proposed, according to the invention, to arrange the distributing pipes laterally outside the die cavity and, in the thermally difficultly controllable die half, to line the melt channel extending therein with the aid of moulding sand between the mouth of the distributing pipes and the beginning of the casting.
