Abstract (en)

The concrete slab (1) rests, by means of small shattering boards (7) which remain visible when the construction is completed, on shoulders (6) presented by the beams (2), provided on either side of a narrow portion (2b) of each of the said beams surmounting the main body (2a) of the latter. The portions (2b) are perforated with transverse holes (3) which pass right through and have a diameter which is sufficient for the concrete to penetrate therein and to form sprues therein which provide the join between the said beams and the slab (1), in such a manner that the beams form reinforcement tie rods for the slab and such that the shearing forces are thus absorbed. The concrete sprues passing through the holes (3) are reinforced by metal rods (4) folded into the form of clamps and by straight metal rods (5) extending over the entire length of the slab, passing through all of the construction beams in succession. <IMAGE>

Abstract (fr)

La dalle de béton (1) repose, par intermédiaire de planchettes de coffrage (7) qui restent apparentes une fois l'ouvrage terminé, sur des épaulements (6) que présentent les poutres (2), ménagés de part et d'autre d'une partie étroite (2b) de chacune desdites poutres surmontant le corps principal (2a) de celle-ci. Les parties (2b) sont percées de trous transversaux traversants (3), d'un diamètre suffisant pour que le béton y pénètre et y forme des carottes assurant la liaison entre lesdites poutres et la dalle (1), de telle manière que les poutres constituent des tirants d'armature de la dalle et que les efforts tranchants soient ainsi absorbés. Les carottes de béton traversant les trous (3) sont armées par des fers (4) pliés en forme d'étriers de même que par des fers rectilignes (5) s'étendant sur toute la longueur de la dalle en traversant successivement l'ensemble des poutres de l'ouvrage.
