Abstract (en)

[origin: US5006217A] In an arrangement for contacting a mold with and holding it on a table, the outer edge of the mold is to be screened from undesired growths by electrodeposition through the use of an elastic collar which embraces the table, while holding and contacting the mold in a reliable manner. This object is achieved in that the table comprises a contact plate which together with the table and the mold forms an annular space for a radial annular flange of the collar, and in that the outer flange is stretched around the table in such a manner that further holding members of the collar urge the mold onto the contact plate through its annular circumferential surface.
