Abstract (en)

[origin: JPH02112944A] PURPOSE: To provide an apparatus constituted so as to simplify the transmission of individual commands by making a visible marking movable on the display screen of a display device in the same way as the deflection of light beam on a printing original plate. CONSTITUTION: An optical marking 8 is generated on a printing original plate 2 by a light source 10. Coordinates signals being usual X- and Y-signals are generated by a controller 14 and the light source 10 is subjected to revolving operation in two directions of a coordinates system by a control unit 13 to be turned to any part of the printing original plate 2. A marking 8' is moved on a screen 7 simultaneously with the marking 8 on the printing original plate 2 by the action of the control unit 13. An operator can operate an ink zone adjuster 20 by either one of a keyboard and a direct touch control screen in order to regulate the necessary demand related to ink or a damper.
