Abstract (en)

[origin: JPH0299616A] PURPOSE: To provide a grid for an opening arm of bale-opener capable of automatically adjusting the depth of penetration depending on the bale hardness by pressing a grid bar at a position corresponding to the minimum depth of penetration with a spring device set at a specific spring force. CONSTITUTION: The minimum depth of penetration is determined by pressing down a grid bar 23 by a spring device whose spring force is set so that the grid bar is moved into a position at least corresponding to the optimum depth of penetration at each time in the direction of increasing the depth of penetration of the grid bar in accordance with the hardness of each bale, and pressing an end 36 of a long hole notch 30 to a guide bar 29.
