Abstract (en)

[origin: EP0354796A1] An earth working apparatus has a flexible helical coil (12) mounted on a frame (11) for rotation about its longitudinal axis. In operation the coil rotates about a substantially horizontal axis by the effect of contact of the earth with the coil as it is dragged across the ground, for example by a tractor. A means for cleaning the coil (12) comprises a plurality of cleaning and camming bodies (22, 22a, 27, 27a) supported on a shaft (18) which extends substantially parallel to the longitudinal axis of the coil and is mounted on the frame (11) to be reciprocable generally towards and away from said coil. The cleaning and camming bodies (22, 22a, 27, 27a) protrude into, and engage, the coil and are arranged to produce a camming action between said bodies and the coil to move the shaft (18) away from the coil (12) against the action of biasing means (24). The reciprocation of the shaft enables the cleaning and camming bodies (22, 22a, 27, 27a) which protrude into the coil for cleaning, to be moved out of any potential jamming position.
