Abstract (en)

[origin: EP0355298A2] The air gap of the ferrite core in a transformer for a switching power supply generates a magnetic stray field which can lead to eddy-current losses in adjacent copper windings. By inserting ferrite plates into the air gap, the air gap is split into a plurality of partial air gaps, so that the spatial extent of the magnetic stray field is reduced. The invention is employed particularly for switching power supplies for television sets.
